**SUMMARY**

- In order to help procurers to identify disinfectants with low impact on health and environment, the City of Vienna set up the Viennese Database for Disinfectants (WIDES).
- WIDES ranks and scores products across a number of hazard categories, and all departments are required to use it for purchasing.
- The city evaluated the procurement of disinfectants across five departments, and an analysis with the help of WIDES showed that only three out of 21 disinfectant products used had a low benchmarking performance.
- The evaluation process has enabled targeted changes in procurement practice.
Background

The use of disinfectants is necessary for tackling germs and preventing the spread of infections. However, they can also pose risks to human and environmental health. In contrast to other product groups, such as cleaning agents or cosmetics, none of the existing ecolabels cover disinfectants. Institutions and facilities of the City of Vienna use more than 400 tonnes of disinfectants annually. Main users are hospitals, nursing homes, schools and kindergartens. Disinfectants protect against infections and are indispensable for health protection by their core users. A disinfectant’s main property is its antimicrobial efficiency in the area of application.

Green Public Procurement has been a focus in Vienna since 1998, when the City created the "ÖkoKauf Wien" (Eco-Buy Vienna) programme in order to provide ecological criteria and selection tools for product groups purchased by the City. As part of this, a Working Group on 'Disinfection' was created to consider how occupational health and environmental protection could be supported through the careful selection of disinfectants in hospitals, nursing homes, kindergartens and schools. In order to assist with the identification and assessment of hazardous substances associated with different types of commercially available disinfectants, this group created the Viennese Database for Disinfectants (WIDES).

Sustainability profile

Chemical disinfectants are indispensable for healthcare and other areas of hygienic risk, however, they are also a source of health and environmental hazards. The cytotoxic substances used may cause allergies, eczema or asthma in users. Some ingredients are suspected of being carcinogenic or teratogenic. Once these substances enter waste water treatment plants through the sewage system they can impair the cleaning performance of the sewage treatment plant. Components of low degradability are emitted into the environment, damaging living organisms in water. With no eco-labels for disinfectants available it has been very difficult in the past to choose disinfectants not harmful to the environment and human health (source: Green Public Procurement in the City of Vienna - Impact Analysis, 2014).

Overview of WIDES

WIDES has two functions. The first is the compilation and structuring of information about disinfectants and their ingredients. The database incorporates more than 240 ingredients and around 280 products available on the market. Data on ingredients include classification (that is, hazard statements according to the United Nations' Globally Harmonised System of Classification and Labelling of Chemicals (GHS)), properties and toxicity/eco-toxicity data. Product data considers the application, concentration of classified ingredients, material compatibility and spectrum of activity. Its second function is the assessment of both ingredients and products. The assessment starts with a grouping and scaling of hazardous ingredients using both numbers and a colour code, from pale yellow to deep red, to rank lowest to highest risk (the higher the number the higher the risk).

WIDES rates products according to its evaluation scheme, which takes into account all ingredients with hazardous properties at specific levels of concentration. More detailed explanations are
Assessments of products are presented using the same colour coding scheme of pale yellow to deep red - as shown below.

Since products are grouped in accordance to their application, comparative rankings of disinfectants in six hazard categories are generated (a seventh category is provided for flammable products). When information on a hazard is not available and data is missing, a question mark is inserted. To rank disinfectant products, users select the required field of application, the spectrum of activity, and time exposure. This generates a product grid which looks like the following:

<table>
<thead>
<tr>
<th>Hazard categories:</th>
<th>Acute toxicity (respiratory tract)</th>
<th>Irritation and corrosivity</th>
<th>Allergenic potential</th>
<th>Mutagenic, carcinogenic, toxic for reproduction, chronically toxic</th>
<th>Behaviour in surface water - Acute*</th>
<th>Behaviour in surface water - Chronic*</th>
</tr>
</thead>

* The ecotoxic assessment will be implemented with the next update.

Disinfectants contain a fairly standard set of biocidal active substances. So although the database has been developed based on the Vienna context, it has the potential to be used globally. In January 2018 the WIDES database included information on 57 biocidal active substances. Emphasis is now on covering all substances used for human hygiene included within the Biocidal Product Regulation of the European Union. As such, the database has been shared online in German and English, and is free of charge and open for anyone to use. The ultimate goal of WIDES is to encourage the gradual substitution of the most toxic ingredients used in disinfectants, on a global scale.

**Using WIDES in practice**

The WIDES database helps to identify risk potentials in disinfectants and to substitute them gradually.

Several examples of WIDES in use are described below.
Vienna Hospital Association (KAV): KAV is the umbrella organisation for the city's hospitals, geriatric centres and nursing homes, and in terms of quantity, KAV is the largest user of disinfectants in Vienna. KAV has used WIDES to consider the substitution potential of alternative disinfectant products. Therefore, a team of hygiene experts drew up a recommendation list and performance profile for hand, surface, instruments and skin disinfectants, while WIDES operators proposed alternatives with less impacts on human health and on the environment. This profile contains information on the amounts required, size of packaging, range of efficacy, etc. With input from both teams, it was possible for KAV to take an informed and calculated approach to substitution. The list of recommendations is updated every other year so that any new findings from the data available on hazards of disinfectants and interesting new product developments can be integrated regularly.

Vienna’s Working Group ‘Disinfection’ has contributed significantly to making employment and environmental protection easier and more transparent for the procurement of disinfectants. Kindergartens in Vienna also procure disinfectants upon consultation with the Working Group and according to the WIDES results.

Furthermore, the application of WIDES is recommended by the Austrian Action Plan for Sustainable Public Procurement and by the Austrian Study Group on Indoor Air Quality.

Selecting low hazard disinfectants (for pregnant workers): in 2015 the Central Labour Department of the Austrian Federal Ministry of Labour, Social Affairs and Consumer Protection published a Decree about hand disinfectants for pregnant employees. This only allows the use of hand disinfectants where certain hazards are excluded. In particular, products are excluded which contain substances classified as carcinogenic, mutagenic, repro-toxic, sensitizing, chronic or (highly) acute toxic and substances with a lack of data in these categories. Instead of requiring the checking of safety data sheets and EU REACH Registration Dossiers in each case, which would be a laborious process, the Decree recommends to screen the colour code of the WIDES product assessment and thereby quickly select products without above named hazards. The Decree is highly influential, as most hospitals would only want to procure disinfectants that can also be used by pregnant employees as standard.

The WIDES database will be developed further in 2019 so that it can additionally provide a selection function to exclude products with specified hazards. This function is intended to test the market supply of low hazardous products prior to a tendering process.

In terms of costs, the WIDES database costs around € 50,000 per year, and is financed by the City of Vienna, the Austrian Workers Compensation Board, and the Austrian Federal Ministry of Sustainability and Tourism. Most of the work on WIDES was and is being done by the Bureau for Chemical Engineering TB-Klade. http://www.tb-klade.at/en/

Results

WIDES Criteria allows for a simultaneous assessment of health and environmental impacts. Benefits include:

www.procuraplus.org
• Reducing allergenic, toxic, carcinogenic, mutagenic and teratogenic components improves the working conditions for employees using disinfectants. Allergenic fragrances and aldehydes, for example, have been phased out in all hospitals of the KAV. The products with the highest toxicological burden in WIDES have disappeared from the market in the last few years. Its widespread use by companies, hospitals, and the legal relevance for maternity protection have all contributed positively to its further development.

• WIDES helps to strengthen initiatives for environmentally sound procurement. The working group ‘Disinfection’ networks at a national and international level (e.g. cooperation with Health Care without Harm - Europe, World Health Organisation, etc.) and presents their activities at international conferences and meetings.

• The toxicological data, that are integrated and regularly updated in WIDES, can be used and applied in different national contexts. It can support all purchasers of disinfectants to choose products containing active substances with low hazard potential: www.wien.gv.at/wuawides/internet/Inhaltsstoffsuche/Bewertungen

According to a decree of the City of Vienna, all city departments are obliged to use the WIDES database (including the KAV, kindergartens, ambulance services, baths, schools and laundry services) to identify disinfectants with low hazardous properties. In 2014, the "Disinfection" working group evaluated whether all relevant purchases knew of and used the WIDES database. An analysis of the products purchased, quantities, and how hazardous they were compared to less hazardous alternatives available on the market. A benchmarking scheme was developed in order to calculate the emissions of highly hazardous substances in kilograms per year. Analysis showed that out of 21 products, only three demonstrated a low benchmarking performance. As a consequence, the annual consumption of one product could be halved, an antimicrobial soap was replaced by a conventional soap. One product could not be substituted due to material incompatibilities.

The WIDES database significantly contributes to transparency on the disinfectant market. Its impact is reflected in rising purchases of disinfectants with low risk potential and in the influence on producers it entails. The amount of substances harmful to the environment or human health has therefore been reduced. Detailed quantification of the reduced harm to the environment and human health requires precise procurement volumes for the individual product groups.

The WIDES database is one of a kind internationally and has subsequently stirred much national and international interest. WG Disinfection has already presented the WIDES database at international conferences and meetings and also does a lot of networking.

Lessons learned

Two factors were especially relevant for the successful substitution of hazardous substances by the WIDES database:

1. The legal commitment of its use by local government decrees enacted by the City of Vienna, the KAV and the Ministry for Social Affairs.
2. The high service orientation of the operators of the database to acquaint procurers despite their work load with the instrument WIDES and to consult them actively in choosing the optimal and at the same time affordable products.

About Procura+

Initiated and co-ordinated by ICLEI, Procura+ is a network of European public authorities and regions that connect, exchange and act on sustainable and innovation procurement.

Connect.

We are a network of European public authorities that connect, exchange and act on sustainable and innovation procurement.

Exchange.

Our combined knowledge and experience allows us to provide advice, support and publicity to any public authority that wants to implement sustainable and innovation procurement.

Act.

The Procura+ Network joins forces to champion sustainable and innovation procurement at the European level.
